## ACADEMIC PROJECTS

- Created a data warehouse consisting of multiple tables. The warehouse was then used for processing data on the sales and profit of a company. I was the leader of the group and had to make sure everything was working perfectly together. The program developed was also used to track purchase history to see any trends that customers may have when buying certain products.
- Developed a server side PHP program to track the business analytics of a website. This assignment was done in a group. The web app created was used to generate revenue for the company by displaying ads and taking feedback from users to sell to companies.
- Created an android application that retrieves data about E.coli levels in Toronto beaches and updates as the information changes automatically. The app would grab data automatically from beach water test samples database found online and update every time the app was used. This kept the results always accurate.

## EMPLOYMENT
